## Abstract of JP 2001251525 (A)

**PROBLEM TO BE SOLVED:** To eliminate the work which is required for addition of a new device, that performs the same processings as existing modules, and rewrites and examination part in a dependent module in a device driver, comprised of a core driver module common to plural devices and dependent modules dependent upon processing peculiar to devices. **SOLUTION:** In the information processing method which switches dependent module for use according to the device ID of an image output device, a database is retrieved on the basis of the inputted device ID to acquire a process ID corresponding to a dependent module, and this process ID is transferred to the dependent module to perform error check about correspondence between the device and the dependent module.
